                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             http://ftp.genome.washington.edu/RM/RepeatMasker.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        All repeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NOTE: This record contains 80 individual sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones.
                                                                                                                                                                                                                                                                                                                                 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp in 100 bp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAC97991 to AAC98763 encode the human colon cancer associated proteins, CC called human colon cancer antigens, given in AAB53234 to AAB54006. The chuman colon cancer antigens can have cytostatic, cardioactive, muscular; cc human colon cancer antigens can have cytostatic, cardioactive, muscular; cc valuerary, nephrotropic, antiinfective and antibacterial activities, and CC can be used in gene therapy. The colon cancer antigen polynucleotides, cc proteins and antibacies to the proteins are useful for the prevention, cc treatment and diagnosis of colon disorders, such as colon cancer. The CC polynucleotides may be used in diagnostics and research, such as for CC chromosome identification, and as hybridisation probes. The proteins CC may also be used to prevent diseases such as neural disorders, immune c system disorders, muscular disorders, reproductive disorders, infectious CC diseases, and cardiovascular disorders. AAC98764 to AAC98772 and CAAB54007 represent sequences used in the exemplification of the present of overlation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                     The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82144 represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AAB25620 to AAB25663 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81304 and AAA81312 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA81322 to AAA81259 and AAA81304 to AAA81312 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodi against them, can be used in the manufacture of a composition. The

sequences which overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF21544 is repeated at the beginning of AAF21607, the last 49980 bp of AAF21607 are repeated the beginning of AAF21608, and so on). AAF21545 to AAF21588 encode the
                                                                                                  The present invention describes the full length genome of Neisseria meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequence was too long to go in a record on its own it was split into 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             be components of vaccines against Meningococcus B; against all serotypes and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pizza M, Hi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Neisseria proteins given in AAB58550 to AAB58593, and AAF21589 to AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for treating or preventing infection due to Neisserial bacteria or as a diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised to Neisserial bacteria. Computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines than the outer membrane proteins currently
                                                                                                                                                               WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
```

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AAB25620 to AAB2563 represent Neisseria DNA sequences and their corresponding proteins; AAA81254

Neisseria DNA sequences and their corresponding proteins; AAA AAA81259 and AAA81304 to AAA81321 represent PCR primers used isolation of Neisseria meningitidis DNA sequences; and AAA813

ç

ç

Isolated nucleotide sequences of Neisseria meningitidis which can used in the diagnosis and treatment of N. meningitidis infection ϵ other Neisserial infections, for example, N.gonorrhoea -

infection and

CC sequences, which are all used in the exemplification of the present
CC invention. The nucleic acid sequences, protein sequences, and antibodies
CC composition can be used in the manufacture of a composition. The
CC composition can be used as a medicament (or in the manufacture of a
CC medicament) for treating, preventing or diagnosing infection due to
CC Neisserial bacteria. For example, some of the identified proteins could
CC be components of vaccines against Meningococcus B; against all serotypes;
CC and/or against all pathogenic Neissariae. Identification of sequences
CC from the bacterium will also facilitate production of biological probes,
CC particularly organism-specific probes. Attempts to make efficacious
CC Multivalent vaccines have failed mainly due to antigen tolerance.
CC Multivalent vaccines have also been tried but none have successfully
CC overcome antigenic variability. The provision of further, complete
CC sequences may provide an opportunity to identify secreted or surface
CC exposed proteins that may be presumed targets for the immune system and
CC which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            403322
                                                                                                                                The present sequence is part of an essential gene from Drosophila melanogaster. Lack of expression of the protein encoded by this gene leads to a lethal or semi-lethal phenotype. The invention relates to 902 nucleic acid sequences from genes encoding proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI;
which are thought to be essential, and to a screening assay for identifying compounds which have a physiological effect on these proteins. Suitable compounds are useful as pesticides and may be in conjunction with other pesticides and herbicides for crop
                                                                                                                                                                                                                                                                                                                                                                               Screening assa

                                                                          The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the problem hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the human breast of the beautiful the proposition of development.
                                                       of the breast, fibrocystic non-carcinoma tumours.

                                                                                                                                                                                                                                                                                                                                                            The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene
                                                                                                                                                                                                                                                                      expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells -
                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 2001-488901/53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (MOLE-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       04-OCT-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21-SEP-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying expression in samples derived from human placenta. The probes at for antenatal diagnosis of human genetic disorders.

The present sequence is one such probe are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel

The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAV06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAV06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.

The invention relates to a novel method of assessing the cardiov status in an individual and to newly identified polymorphisms in genes encoding angiotensin-converting enzyme (ACE), angiotensin receptor type 1 (AT1) and type 2 (AT2), angiotensinogen (AGT), r

beta-adrenergic

(AGT), renin

the cardiovascular

CC Fragments of the genes comprising a polymorphic site may be used as CC primers and probes for detecting genetic polymorphisms or in molecular CC library arrays for high throughput screening. The genes, and the proteins CC they encode are useful in the screening of potential cardiovascular CC drugs. Determination of an individual's polymorphic pattern reduces or CC eliminates trial and error in selecting a treatment for a particular CC individual cardiovascular patient. It also provides the ability to CC eliminate patients from clinical trials who are predicted to be CC individual cardiovascular patient. It also provides the ability to CC eliminate patients from clinical trials who are predicted to be CC individual cardiovascular patients in an early trial can be evaluated to increasinent regimen. Adverse results in an early trial can be evaluated to CC identify polymorphic patterns so that the adverse results can be CC correlated with a sub-population of the test population, permitting CC exclusion of such sub-populations from the treatment group. Beneficial CC drugs can be approved for use in the appropriate population, thereby CC currents of the duration and cost of such trials. Sequences A38324 cc A38327 represent exons 2, 3, 4 and 5 of the human angiotensingen gene CC coding region (GenBank M24686-M24689). The polymorphic sites identified CC at mostifion 49 in exon 4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pattern of polymorphisms from the individual with a reference polymorphi pattern obtained from a population of individuals exhibiting a predetermined cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to cardiovascular disorders such as myocardial infarction, unstable angina, hypertension, atherosclerosis and stroke. They are also useful for predicting the likely cardiovascular status of a pattent given a treatment regimen comprising administration of cardiovascular drugs (e.g., ACE inhibitors, beta-arenergic receptor antagonists (beta-blockers) or calcium channel blockers). One or more polymorphic markers provides a basis for predicting the outcome of a treatment regimen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5. This sequence was isolated by PCR using the primers given in AAQ47068-72. Primer 21B4 corresponds to part of the repeated region of 21B4/rhoptry antigen. In hybridisation assays this primer recognised two trandemly repeated regions suggesting that B bovis contains two copies of the 21B4/rhoptry antigen gene. The two proteins encoded by the two antigen genes are identical. Primers 21B4.2 and 21B4.3 flank the 21B4-309 cooling region of the antigen gene. Primer 21B4.4 primes synthesis just 3 to the end of the open reading frame. The entire open reading frame was shown to encode five antigen genes. The 3 non-repetitive sequences of open reading frame to the open reading frame. Babesia antigen genes can be used in the production of a combined vaccine which will stimulate a greater immune
                                                                                                                                         09-MAR-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting closely linked gene copies which encode protective antigen against babesiosis - by screening babesial genomic DNA library with oligo-nucleotide probe based partial sequencing of protective antigen and identifying positive clones
                                                                                                      Human pancreatic
                                                                                                                                                                                                        971/c

This sequence was isolated by PCR using the primers given it AAQ47068-72. Primer 21B4.1 corresponds to part of the repeater region of 21B4/rhoptry antigen. In hybridisation assays this part of the repeater of the repeater region of 21B4/rhoptry antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymerase chain reaction; PCR; amplify; primer; detection; babesiosis; parasite; Babesia bovis; 21B4/rhoptry; antigen; repeat region; immune response; vaccine; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAC98773 to AAC99231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AAB54008 to AAB54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be us in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used detect, treat or prevent pancreatic disorders, especially cancer.

Agonists and antagonists to the antigens can be screened for. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pancreatic cancer antigen polynucleotides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular,
                                                                                       08-FEB-2001

                                                                                                                                                                           the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                             N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present SEQ ID NO:1027 to 1052, 7921 and 7922.

                                                                                                                                                                                                                                                                                                                                                                                                  CC mutant alleles of which cause a susceptibility to insulin dependent CC diabetes meallitus (IDDM, type I diabetes). The AGT gene is located CC on chromosome 1942-43, a region linked to IDDM. The invention CC discloses genomic sequences comprising exons 1-5 of the human AGT gene CC (AAC91600-C91604) and a genomic sequence comprising an alternative AGT CC gene exon 1 (AAC91606). The invention also encompasses the specifically CC claimed human AGT mutant nucleic acid sequences AAC91667-C91684, and the CC mutant angiotensinogen proteins AAB48945-B48949. The invention also relates to detecting mutant AGT alleles or gene products thereof which CC are related to IDDM; determining whether a person has, or is at risk of CC developing diabetes via detection of a polymorphism in the AGT gene; and CC methods of screening for drug candidates which may be useful in the CC treatment of diabetes resulting from an AGT mutation. Methods of CC reventing or treating diabetes are claimed which comprise the CC administration of a compound which agonises or antagonises wild-type or CC mutant AGT, which agonises or antagonises or antagonises wild-type or inhibits AGT gene expression, or which cleaves AGT proteins. In addition, CC inhibits AGT gene expression, or which cleaves AGT proteins. In addition, CC inhibits AGT modulators can be used to treat or prevent diabetes. Mutant CC AGT proteins or fragments thereof are useful for screening compounds of the compounds of the compounds thereof are useful for screening compounds.

The invention relates to the human angiotensinogen (AGT) gene, some mutant alleles of which cause a susceptibility to insulin-dependent diabetes mellitus (IDDM, type I diabetes). The AGT gene is located on chromosome 142-43, a region linked to IDDM. The invention discloses genomic sequences comprising exons 1-5 of the human AGT gene (AAC91600-C91604) and a genomic sequence comprising an alternative AGT gene exon 1 (AAC91606). The invention also encompasses the specifically claimed human AGT mutant nucleic acid sequences AAC91667-C91884, and the mutant angiotensinogen proteins AAB48945-B48949. The invention also relates to detecting mutant AGT alleles or gene products thereof which are related to IDDM; determining whether a person has, or is at risk of developing diabetes via detection of a polymorphism in the AGT gene; and methods of screening for drug candidates which may be useful in the
                                                                                                                                                                                     inhibits AGT gene expression, or which cleaves AGT proteins. In addition, the invention encompasses a transgenic non-human animal, or cell line derived therefrom, comprising a mutant human AGT allele. The polymorphisms identified in the AGT gene are useful for determining if a person has, or is at risk from developing insulin-dependent diabetes mellitus. AGT modulators can be used to treat or prevent diabetes. Mutant AGT proteins or fragments thereof are useful for screening compounds which bind to AGT polypeptides. The present sequence represents a portion of the human AGT gene comprising a mutant 5' region fragment, and exon
                                                                                                                                                                                                                                                                                                                                                                                   treatment of diabetes resulting from an AGT mutation. Methods of preventing or treating diabetes are claimed which comprise the administration of a compound which agonises or antagonises wild-type or mutant AGT, which agonises or antagonises an AGT receptor, which
                                                                                  Sequence

YX Claim 2: Page -: 83pp: En.
XX Wovel angiotensinogen general interestion of which concurrence interestion of which concurrence interestion of acquency concurrence for characted to IDDM; detecting mutant are related to IDDM; detecting muta
                                                             cc mutant alleles of which cause a susceptibility to insulin-dependent CC diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located CC on chromosome 1942-43, a region linked to IDDM. The invention CC discloses genomic sequences comprising exons 1-5 of the human AGT gene (AAC91600-C91604) and a genomic sequence comprising an alternative AGT gene exon 1 (AAC91606). The invention also encompasses the specifically CC claimed human AGT mutant nucleic acid sequences AAC91667-C91684, and the mutant angiotensinogen proteins AAB48945-B48949. The invention also CC relates to detecting mutant AGT alleles or gene products thereof which CC are related to IDDM; determining whether a person has, or is at risk of CC developing diabetes via detection of a polymorphism in the AGT gene; and CC methods of screening for drug candidates which may be useful in the CC administration of a compound which agonises or antagonises wild-type or CC mutant AGT, which agonises or antagonises wild-type or CC inhibits AGT gene expression, or which cleaves AGT proteins. In addition, the invention encompasses a transgenic non-human animal, or cell line CC polymorphisms identified in the AGT gene are useful for determining if a method bind to AGT modulators can be used to treat or prevent diabetes. Mutant AGT proteins or fragments thereof are useful for cereening compounds CC which bind to AGT polypeptides. The present sequence represents a portion CC in the human AGT gene comprises on the wild-type human AGT gene 5' region/exon 1 sequence CC shown on page 60-63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel angiotensinogen gene, mutant alleles of which causes susceptibility to insulin-dependent diabetes mellitus useful for diagnosis of predisposition to diabetes -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the human angiotensinogen (AGT) gene, some

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAC91672,
                                                                                                                                                         The invention relates to the human angiotensinogen (AGT) gene, some CC mutant alleles of which cause a susceptibility to insulin-dependent CC diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located CC on chromosome 1q42-43, a region linked to IDDM. The invention CC discloses genomic sequences comprising an alternative AGT CC (AAC91600-C91604) and a genomic sequence comprising an alternative AGT CC (AAC91600-C91604). The invention also encompasses the specifically CC mutant angiotensinogen proteins AAB48945-B48949. The invention also CC relates to detecting mutant AGT alleles or gene products thereof which CC are related to IDDM; determining whether a person has, or is at risk of CC developing diabetes via detection of a polymorphism in the AGT gene; and CC developing diabetes resulting from an AGT mutation. Methods of creening for drug candidates which may be useful in the CC treatment of diabetes resulting from an AGT mutation. Methods of correction of a compound which agonises or antagonises wild-type or mutant AGT, which agonises or antagonises an AGT receptor, which comprises an AGT genes and CC inhibits AGT gene expression, or which cleaves AGT proteins. In addition, the invention encompasses a transgenic non-human animal, or cell line correct has or is at triky from downland animal, or cell line derived therefrom, comprising a mutant human AGT allele. The
             person has, or is at risk from developing insulin-dependent diabetes mellitus. AGT modulators can be used to treat or prevent diabetes. Mutant AGT proteins or fragments thereof are useful for screening compounds which bind to AGT polypeptides. The present sequence represents a portion of the human AGT gene comprising a mutant 5' region fragment, and exon 1. Note: The present sequence is not shown in the specification, but is derived from the wild-type human AGT gene 5' region/exon 1 sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel angiotensinogen gene, mutant alleles of which causes susceptibility to insulin-dependent diabetes mellitus useful for diagnosis of predisposition to diabetes -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human angiotensinogen gene; AGT; insulin-dependent diabetes mellitus; type 1 diabetes; chromosome 142-43; single nucleotide polymorphism; IDDM; SNP; diagnosis; susceptibility; transgenic animal; drug screeni antidiabetic; gene therapy; 5' region; mutant; exon 1; ds.

The invention relates to the human angiotensinogen (AGT) gene, some CC mutant alleles of which cause a susceptibility to insulin dependent CC diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located CC on chromosome 1942-43, a region linked to IDDM. The invention CC discloses genomic sequences comprising exons 1-5 of the human AGT gene CC (AAC91600-C91604) and a genomic sequence comprising an alternative AGT CC gene exon 1 (AAC91606). The invention also encompasses the specifically CC claimed human AGT mutant nucleic acid sequences AAC91667-C91684, and the CC mutant angiotensinogen proteins AAD84945-B48949. The invention also CC relates to detecting mutant AGT alleles or gene products thereof which CC are related to IDDM; determining whether a person has, or is at risk of CC developing diabetes via detection of a polymorphism in the AGT gene; and CC methods of screening for drug candidates which may be useful in the CC preventing or treating diabetes are claimed which comprise the CC administration of a compound which agonises or antagonises wild-type or mutant AGT, which agonises or antagonises an AGT receptor, which comprising a mutant human animal, or cell line CC inhibits AGT gene expression, or which cleaves AGT proteins. In addition, CC the invention encompasses a transgenic non-human animal, or cell line CC polymorphisms identified in the AGT gene are useful for determining if a person has, or is at risk from developing insulin-dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 22

                        discloses genomic sequences comprising exons 1-5 of the human AGT gene (AAC91600-C91604) and a genomic sequence comprising an alternative AGT gene exon 1 (AAC91605). The invention also encompasses the specifically claimed human AGT mutant nucleic acid sequences AAC91667-C91684, and the mutant angiotensinogen proteins AAB48945-B48949. The invention also relates to detecting mutant AGT alleles or gene products thereof which are related to IDDM; determining whether a person has, or is at risk of developing diabetes via detection of a polymorphism in the AGT gene; and methods of screening for drug candidates which may be useful in the
                                                                                                                                                                       mutant alleles of which cause a susceptibility to insulin-dependent diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located on chromosome 1q42-43, a region linked to IDDM. The invention

The present sequence represents a of the human AGT gene comprising a mutant 5' region fragment, and 1. Note: The present sequence is not shown in the specification, derived from the wild-type human AGT gene 5' region/exon 1 sequence shown on page 60-63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human angiotensinogen gene; AGT; insulin-dependent diabetes mellitus; type 1 diabetes; chromosome 1q42-43; single nucleotide polymorphism; IDDM; SNP; diagnosis; susceptibility; transgenic animal; drug screeni
treatment of diabetes resulting preventing or treating diabetes
                                                                                                                                                                                                                           The invention relates to the human angiotensinogen (AGT) gene,
                                                                                                                                                                                                                                                        Claim

The invention relates to the human angiotensinogen (AGT) gene, some mutant alleles of which cause a susceptibility to insulin-dependent diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located on chromosome 1q42-43, a region linked to IDDM. The invention discloses genomic sequences comprising exons 1-5 of the human AGT gene (AAC91600-C91604) and a genomic sequence comprising an alternative AGT gene exon 1 (AAC91606). The invention also encompasses the specifically claimed human AGT mutant nucleic acid sequences AAC91667-C91684, and the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AGT proteins or fragments thereof are useful for screening compounds which bind to AGT polypeptides. The present sequence represents a polypeptide a mutant 5' region fragment, and exc 1. Note: The present sequence is not shown in the specification, but derived from the wild-type human AGT gene 5' region/exon 1 sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       administration of a compound which agonises or antagonises wild-type or mutant AGT, which agonises or antagonises an AGT receptor, which inhibits AGT gene expression, or which cleaves AGT proteins. In addition, the invention encompasses a transgenic non-human animal, or cell line derived therefrom, comprising a mutant human AGT allele. The polymorphisms identified in the AGT gene are useful for determining if a person has, or is at risk from developing insulin-dependent diabetes mutant mentitus. AGT modulators can be used to treat or prevent diabetes. Mutant
                                                                                                                                                                                                                                                                                                                                                            Novel angiotensinogen gene, mutant alleles of which causes susceptibility to insulin-dependent diabetes mellitus useful for diagnosis of predisposition to diabetes -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       21-MAY-1999; 99US-0135423

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 person has, or is at risk from developing insulin-dependent diabetes mellitus. AGT modulators can be used to treat or prevent diabetes. Mutant AGT proteins or fragments thereof are useful for screening compounds which bind to AGT polypeptides. The present sequence represents a portion of the human AGT gene comprising a mutant 5' region fragment, and exon 1. Note: The present sequence is not shown in the specification, but is derived from the wild-type human AGT gene 5' region/exon 1 sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        mutant AGT, which agonises or antagonises an AGT receptor, which inhibits AGT gene expression, or which cleaves AGT proteins. In addition, the invention encompasses a transgenic non-human animal, or cell line derived therefrom, comprising a mutant human AGT allele. The polymorphisms identified in the AGT gene are useful for determining if a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            relates to detecting mutant AGT alleles or gene products thereof which are related to IDDM; determining whether a person has, or is at risk of developing diabetes via detection of a polymorphism in the AGT gene; and methods of screening for drug candidates which may be useful in the treatment of diabetes resulting from an AGT mutation. Methods of preventing or treating diabetes are claimed which comprise the administration of a compound which agonises or antagonises wild-type or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC mutant alleles of which cause a susceptibility to insulin-dependent CC diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located CC on chromosome 1942-43, a region linked to IDDM. The invention CC discloses genomic sequences comprising exons 1-5 of the human AGT gene CC (AAC91600-091604) and a genomic sequence comprising an alternative AGT CC gene exon 1 (AAC91606). The invention also encompasses the specifically CC claimed human AGT mutant nucleic acid sequences AAC91607-091684, and the CC mutant angiotensinogen proteins AAB48945-B48949. The invention also CC relates to detecting mutant AGT alleles or gene products thereof which CC are related to IDDM; determining whether a person has, or is at risk of CC methods of screening for drug candidates which may be useful in the CC treatment of diabetes resulting from an AGT mutation. Methods of CC mutant AGT, which agonises or antagonises or antagonises wild-type or CC mutant AGT, which agonises or antagonises wild-type or CC mutant AGT, which agonises or antagonises wild-type or CC mutant AGT, which agonises or antagonises wild-type or CC mutant AGT, which agonises or antagonises an AGT proteins. In addition, the invention encompasses a transgenic non-human animal, or cell line CC polymorphisms identified in the AGT gene are useful for determining if a CC person has, or is at risk from developing insulin-dependent diabetes CC mellitus. AGT modulators can be used to treat or prevent diabetes Mutant CC which bind to AGT polypeptides. The present sequence represents a portion of the human AGT gene comprising a mutant by region fragment, and exon CC shown on page 60-63. The present sequence is not shown in the specification, but is CC shown on page 60-63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

Amp inhibitors are potentially useful as antihypertensive agents and to prevent or treat arterial (re)stenosis or atherosclerosis. The structure of Amp is used to design synthetic substrates, e.g. for use in Amp assays. Amp, which hydrolyzes N-terminal imido bonds, can be used to degrade industrial protein feeds to free amino acids, to degrade proteinaceous wastes, as additives in enzyme formulations used to treat malabsorption syndrome and for studying its biological role. Antibodies against Amp are used in immunohistochemical methods to study Amp distribution.
                                            Novel angiotensinogen gene, mutant alleles of which causes susceptibility to insulin-dependent diabetes mellitus useful for diagnosis of predisposition to diabetes -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The invention relates to the human angiotensinogen (AGT) gene, some CC mutant alleles of which cause a susceptibility to insulin-dependent CC diabetes mellitus (IDDM, type 1 diabetes). The AGT gene is located CC on chromosome 1442-43, a region linked to IDDM. The invention CC discloses genomic sequences comprising exons 1-5 of the human AGT gene (AAC91600-C91604) and a genomic sequence comprising an alternative AGT CC gene exon 1 (AAC91605). The invention also encompasses the specifically claimed human AGT mutant nucleic acid sequences AAC91667-C91684, and the CC mutant angiotensinogen proteins AAB48945-B48949. The invention also relates to detecting mutant AGT alleles or gene products thereof which CC are related to IDDM; determining whether a person has, or is at risk of CC methods of screening for drug candidates which may be useful in the CC methods of screening diabetes are claimed which comprise the CC mutant AGT, which agonises or antagonises or antagonises wild-type or administration of a compound which agonises or antagonises wild-type or administration of a compound which agonises or antagonises wild-type or compound to a compound which agonises or antagonises wild-type or compound to a compound which agonises or antagonises wild-type or compound which agonises an AGT receptor, which compound which agonises an AGT receptor. Which compound which agonises an AGT receptor which compound which agonises an AGT receptor. The compound which agonises are useful for determining if a person has, or is at risk from developing insulin-dependent diabetes. Mutant CC mellitus. AGT modulators can be used to treat or prevent diabetes. Mutant CC mellitus. AGT modulators can be used to treat or prevent diabetes. Mutant CC mellitus. AGT modulators can be used to treat or prevent diabetes. Mutant CC mellitus or fragments thereof are useful for screening compounds which because of the present sequence represents a human AGT intention of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

include: substance use disorders; obesity; alcohol, tobacco or other drug use; Tourette syndrome; attention deficit hyperactivity disorder (ADHD); schizoid/avoidant behaviour; aggression; premenstrual syndrome; violence; hostility; mania; depression; anxiety; sleep problems, autism Methods given in the invention can be applied for diagnosis of RDS or e.g. elevated levels of low density lipoprotein (LDD) or cholesterol, longevity, lack of ADHD, osteoporosis. In treatment of obesity, (A) inhibits binge eating and craving. The present sequence represents an oligonucleotide used in an example from the present invention.
                                                                                                                                                                                                                                                                            deficiency syndrome (RDS) behaviour; or (ii) preventing or treating unwanted weight gain. (A) comprises: (a) an agent (I), i.e. amino acid or peptide, or their analogues or derivatives, that inhibits enzymatic destruction of a neuropeptidyl opiate; (b) a neurotransmitter precursor (II) to promote neurotransmitter synthesis, i.e. L-Tyr, L-Phe or L-dopa (dopamine precursors) L-Trp or 5-hydroxytryptophan (serotonin precursors) or L-Glu (or its sait) or L-Gln (gamma-aminobutyric acid precursors); and (c) chromium picolinate or nicotinate to increase the level of Trp. Typical of many behaviours that can be treated with (A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Composition for treating reward deficiency syndrome behaviour, attention deficit disorders or controlling weight - contains inhibitor of opiate peptide destruction, neurotransmitter precipitals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;

Compositions are disclosed which comprise at least one substance that inhibits the enzymatic destruction of a neuropeptidyl opiate, at least one neurotransmitter, a tryptophan concentration enhancing amount of a mineral compound; and at least one substance chosen from Rhodiola extract and huperzine. The compositions are used to treat ADD and ADHD. They are used to treat reward deficiency syndrome (RDS) behaviours including obesity, smoking, Tourette's syndrome, pre-menstrual syndrome or tobacco use. The presence of
  attention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     deficiency syndrome (RDS) behaviour; or (ii) preventing or treating cumwanted weight gain. (A) comprises: (a) an agent (I), i.e. amino acid cor peptide, or their analogues or derivatives, that inhibits enzymatic celestruction of a neuropeptidyl opiate; (b) a neurotransmitter precursor ((II) to promote neurotransmitter synthesis, i.e. Tyr, L-Phe or L-dopa (dopamine precursors) L-Trp or 5-hydroxytryptophan (serotonin precursors) or L-Glu (or its salt) or L-Gln (gamma-aminobutyric acid precursors); and (c) chromium picolinate or nicotinate to increase the clevel of Trp. Typical of many behaviours that can be treated with (A) include: substance use disorders; obseity; alcohol, tobacco or other crug use; Tourette syndrome; attention deficit hyperactivity disorder (ADHD); schizoid/avoidant behaviour; aggression; premenstrual syndrome; violence; hostility; mania; depression; anxiety; sleep problems, autism. Methods given in the invention can be applied for diagnosis of RDS or e.g. elevated levels of low density lipoprotein (LDL) or cholesterol, inhibits binge eating and craving. The present sequence represents an oligonucleotide used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

Compositions are disclosed which comprise at least one substance that inhibits the enzymatic destruction of a neuropeptidyl opiate, at least one neurotransmitter, a tryptophan concentration-enhancing amount of a mineral compound; and at least one substance chosen from Rhodiola extract and huperzine. The compositions are used to treat ADD and ADHD. They are used to treat reward deficiency syndrome (RDS) behaviours including obesity, smoking, Tourette's syndrome, schizoid avoidant behaviour, aggression, post-traumatic stress syndrome, pre-menstrual syndrome or tobacco use. The presence of enkephalin releasers dramatically improves the patient's response to treatment.
AAZ36290-Z36320 represent genes or expressed sequence tags (ESTs) identified by the method of the invention. The sequences were isolated from rat osteoblasts. The specification describes a method for the identification of genes responsive to a specific mechanical stress. The method comprises applying the mechanical stress to an organism (tissue or cells comprising bone cells), isolating the specific cellular fractions and extraction mRNA from them, and differentially analysing the mRNA in comparison with control samples. The method is used to identify genes whose expression is responsive to a specific stress. The identifications are constantly control samples.

                                      The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               genes are employed in determining risk associated with a physiological or disease state. The risk determination methods are used for testing a medicament for gene therapy. These medicaments, or genes identified by the method of the invention, are used for treating, preventing or controlling a physiological or disease state (especially osteoporosis or bone density or other factors causing or contributing to osteoporosis or its symptoms or other conditions involved in mechanical stress or its

        The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of pre-metastatic or metastatic cancerous states, stages of cancer, or responsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor-
                                                                                                                                               genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       15-MAY-1998;

                  detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to
                                                                                                                                                       polynucleotides can be used as a source of primers and probes, which coupe used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and
                                                                                                                                                                                                                             of the 5248 polynucleotide sequences given in AAZ12532 to AAZ17779.
                                                                                                                                                                                                                                                     differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by
                                                                                                                                                                                                                                                                                               The present invention describes a library of human polynucleotides comprising the sequences given in ARZ12532 to ARZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammalian cell, comprising detecting at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel human genes and their differentially expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Crkvenjakov R,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8888888
                                      sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a nucleic acid described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                    Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                                                                                                                                                                                                                                                                                                                                                               07-APR-2000;

                  AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antithflammatory; antibacterial; antivital; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The
